The invention relates to a novel screening method comprising a fatty acid and eicosanoid-binding G-protein coupled receptor protein, GPR40, and eicosanoid-binding G-protein coupled receptor protein, GPR40, coriginating in mouse, rat, crab-eating monkey and hamster (sequences fully defined in the specification), equivalent proteins of similar activity, and peptides containing partial sequences of the GPR40 protein. The novel fatty acid and GPR40 protein and their compositions have the following activities: antidiabetic, anabolic, neuroprotective, nephrotropic, ophthalmological, antilipaemic, dermatological, antidipaemic, dermatological, antidipaemic, correctic, hypotensive, and cytostatic. The novel fatty acid and elcosanoid-binding G-protein coupled receptor protein, GPR40, and further compositions can be used in the treatment, prevention and diagnosis of diabetes, ketosis, acidosis, diabetic neuropathy, diabetic retinopathy, hyporlypaemia, skin disease, chiabetic retinopathy, hyporlypaemia, skin disease, arthritis, bone diseases, arteriosclerosis, thrombosis, hypertension, indigetion, menory loss, obesity, hypoglycaemia, edema, insulin resistance, insulin allergy, fat metabolism disorders and cancer. This protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

The invention relates to a novel screening method comprising a fatty acid and elcosanoid-binding G-protein coupled receptor protein, GPR40, originating in mouse, rat, crab-eating monkey and hamster (sequences tully defined in the specification), equivalent proteins of similar activity, and peptides containing partial sequences of the GPR40 protein. The novel fatty acid and GPR40 protein and their compositions have the following activities: antidiabetic, nabbolic, neuroprotective, nephrotropic, ophthalmological, antilipaemic, dermatological, antiarteriosclerotic, antiarthritic, osteopathic, thrombolytic, noctropic, anorectic, hypotennive, and cytostatic. The novel fatty acid and elcosanoid-binding G-protein coupled receptor protein, GPR40, and further compositions can be used in the treatment, prevention and diagnosis of diabetes, ketosis, acidosis, diabetic neuropathy, diabetic retinopathy, hyperlipaemia, skin diseases, arthritis, bone diseases, arteriosclerosis, thrombosis, hypertension, nebrotathy, and sequence represents the DNA encoding a hamster GPR40 protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CGCTGAACCTGTTGGCCATCCGAGGCGCCGTGGCAAGGCTGCGGCTCACCCCC 120

compound binds

gene expression; or (b) detecting whether the

```
The invention relates to screening a test compound to determine whether the compound is a GPR40 receptor (G protein-coupled receptor) ligand comprises detecting whether the test compound competitively inhibits the binding of a fatty acid GPR40 ligand to a GPR40 receptor. Also included are (1) a method of screening a compound for GPR40 antagonist activity, comprising; (a) measuring any detectable signal produced by a reporter gene (comprising a reporter gene under the control of G protein GG responsive transcriptional element); (b) detecting a decrease in reporter gene expression in the presence of both test compound and agonist; or (c) detecting whether the compound decreases glucose-stimulated insulin release from mammalian pancreatic beta cells in the presence of a GPR40 agonist; compared to glucose-stimulated insulin release to the presence of the GPR40 agonist; (2) a method of screening any compound for GPR40 agonist; (a) method of screening any

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           9
                   GPR40 and increases glucose-stimulated insulin release from mammalian pancreatic beta cells. The method is useful for identifying GPR40 antagonist or agonist compounds for treating disorders e.g. type 2 diabetes, obesity, glucose or insulin intolerance, neurodegenerative disease (e.g. Alzheimer's disease) or stroke. The present sequence is mouse cDNA for GPR40
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ccarricaactricriagicaarccaaccacacacaccaccaccaaccaccacricacric

The invention relates to a novel screening method comprising a fatty acid and eicosanoid-binding G-protein coupled receptor protein, GPR40, coriginating in mouse, rat, crab-eating monkey and hamster (sequences fully defined in the specification), equivalent proteins of similar activity, and peptides containing partial sequences of the GPR40 protein. The novel fatty acid and GPR40 protein and their compositions have the following activities: antidiabetic, anabolic, neuroprotective, nephrotropic, ophthalmological, antilipaemic, dermatological, antiarteriosclerotic, antialipaemic, dermatological, antiarteriosclerotic, antiarthritic, osteopathic, thrombolytic, ancertic, hypotensive, and cytostatic. The novel fatty acid and eicosanoid-binding G-protein coupled receptor protein, GPR40, and factosanoid-binding G-protein coupled receptor protein, GPR40, and diagnosis of diabetes, ketosis, acidosis, diabetic neuropathy, diabetic retinopathy, hyporlipaemia, skin diseases, arteriosclerosis, thrombosis, hypertension, indigestion, memory loss, obesity, hypoglycaemia, edema, insulin createner, mentanoe, innulin allergy, fat metabolism disorders and cancer. This polynucleotide sequence represents the DNA encoding a rat GPR40 protein of the invention.
                                                                                                                                                                                      fatty acid; eicosanoid-binding G-protein coupled receptor; GPR40; antidiabetic; anabolic; neuroprotective; nephrotropic; ophthalmological; antilipaemic; dermatological; antiarteritosic; antiarthritic; osteopathic; thrombolytic; nocropic; anorectic; hypotensive; cytostatic; diabetic; ketosis; acidosis; diabetic neuropathy; diabetic nephropathy; bone disease; arthritis; bone disease; arteriosclerosis; thrombosis; hypotension; indigestion; memory loss; obesity; hypoglycemia; edema; insulin resistance; insulin allergy; fat metabolism disorder; cancer; rat; gene; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               testis and human liver using expressed sequence tag analysis. The invention relates to HNFDYZO polypeptides and recombinant materials and methods for their production. It also provides methods for using such polypeptides and HNFDYZO polypeptides of infections such polypeptides and HNFDYZO polypucleds for treatment of infections such polypeptides and HNFDYZO polypucleds for treatment of infections such infections, fungal, protozoan and particularly HIV-1 or HIV-2 infections, and conditions including pain, cancers, anorexia, asthma, Parkinson's disease, acute heart failure, hypotension, hypotension, curinary retention, osteoporosis, angina pectoris, myocardial infarction, utinary retention, osteoporosis, angina pectoris, myocardial infarction, curinary retention, demontia, severe mental retardation and dyskinesias, such as Huntingdon's disease or Gilles de la Tourette's syndrome. Gene therapy using RNA encoding HNRDYZO can be used to treat conditions caused by under-expression of the protein. The invention also relates to methods of identifying agonists and antagonists and for using such compounds to treat conditions associated with inappropriate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            s isolated polynucleotide codes for HNFDY20 (see AAW59924), a novel an 7-transmembrane G-protein coupled receptor. HNFDY20 polynucleotides be obtained from cDNA libraries derived from mRNA in cells of human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          334 GTTCGTCTTCTCGGTGTACCTTCTCACTTTCCTGGTGGGGCTCCCCCTCAACCTGCTGGC

The invention relates to constitutively active, non-endogenous versions of endogenous human orphan G protein-coupled receptors (GPCRs, AAY96643-AAY9069-190687), and to DNA encoding them (AAA30709-A330743) and AAA30775-A30779). The mutant proteins of the invention contain a matation in a portion of the protein comprising intracellular loop 3 (CC) and transmembrane domain 6 (TM6). A non-endogenous amino acid, X, is substituted for an endogenous residue in IC3 at a position 16 amino acids N-terminal of an endogenous proline in TM6 to form a sequence X-CC (AA)15-Pro. The endogenous amino acid is selected from Lys, His, Arg or Ala, and is preferably Lys. When the endogenous residue at this position is Lys, this residue is replaced by His, Arg or preferably Ala. The 15 amino acid stretch between the substituted amino acid and the Pro may be endogenous, non-endogenous, or a mixture of endogenous and non-endogenous creatiques. The constitutively active GPCRs are useful for identifying antagonists and partial agonists for use as pharmaceutical captured are also useful in research settings for a particular GPCR are useful for treating diseases and disorders associated with that receptors in normal and diseases and disorders associated with that receptor. Because the novel mutant GPCRs are constitutively active, they can be used directly for screening of compounds without the need for endogenous ligands. The present sequence compounds without the need for endogenous ligands. The present sequence crepresents cDNA encoding a human wild-type GPCR used in an expensive for invention. This was cloned and subjected to site-directed mutagenesis (SDM) to generate DNA encoding the corresponding the corresponding mutant of the invention Non-endogenous constitutively activated human G protein-coupled receptors, useful for identifying agonists for use as pharmaceutical Example 1; Page 309-310; 341pp; English. The present sequence is that of cDNA encoding human G-protein coupled receptor 42 (GPR 42, see AAB82759). The invention is based on the finding that expression of GPR 42 and GPR 41 (see AAB82758) is restricted to adipose tissue. GPR 41 or GPR 42 may therefore be used as a screening target for the identification and development of novel pharmaceutical agents for use in inhibiting lipolysis. Methods are claimed for identifying agents that modulate GPR 41 or GPR 42 activity, involving: (1) contacting a test agent with GPR 41 or GPR 42 or a variant capable of

in the presence of a G-protein, thereby determining whether the test agent modulates activity. Such agents, which may be an activator of GPR 41 or GPR 42 or uninhibitor of lipolysis, or a polymucleotide encoding GPR 41, GPR 42 or variant polypeptide, are useful for the treatment of dyslipideamia, coronary heart disease, atherosclearosis, thrombossis or obesity, angina, chronic renal failure, peripheral vascular disease, stroke, type II diabetes or metabolic syndrome (syndrome X) (all claimed)
                                                                                                                                                                                                                                                                                                         45 GTTCGTCTTCTCGGTGTACCTTCTCACTTTCCTGGTGGGGCTCCCCCTCAACCTGCTGGC 104

/note="Vector: power_lay; Site 1: loxP-Sall; Site 2: loxP-HindII; Clones from this library have been loxP-HindIII; Clones from this library have been complete open reading frame (based on known gene sequences available from NCBI's RefSeq). Template for PCR is CDNA derived from either pooled cytoplasmic polya RNA from 30 cells lines or pooled cytoplasmic polya RNA from 30 cells lines or pooled total RNA from 10 different tissues (from BD Biosciences/Clontech and Washington University). PCR products are directionally cloned into the loxP sites of the pDNR-Dual vector. Library constructed by Dr. Narayan Bhat, Earl Bere III and Hongling Liao (Gene Expression Laboratory, Research Technology Program, SAIC Frederick, NCI-Frederick, Prederick, MD 21702). For information on which gene each clone represents, please visit our anonymous ftp site at this is a NIH_MGC Library."

                                                                                                                                                                                                                                                                                                                                                                                                                                                             Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 25
